Exercise 12.13.5.4 Five cards are drawn successively with replacement from a well-shuffled deck of 52 cards. What is the probability that

(i) all the five cards are spades?
(ii) only 3 cards are spades?
(iii) none is a spade?

Solution. A deck has 52 cards among which 13 are spades. Since we are replacing drawn cards ,the probability of getting spade on any draw, $p = \frac{13}{52} = \frac{1}{4}$. This is a binomial distribution where getting a card of spades is considered success.

The probability of getting r successes in a binomial distribution having n independent Bernoulli trials and probability of success in each Bernoulli trial being p is

$$P(r) = \binom{n}{r} p^r (1-p)^{n-r} \tag{1}$$

Here, $p = \dfrac{1}{4}$ and $n = 5$.

(i) Probability that all 5 cards are spades is P(5).

$$P(5) = \binom{5}{5}\left(\frac{1}{4}\right)^5\left(\frac{3}{4}\right)^0 \tag{2}$$

$$= \frac{1}{1024} \approx 0.00098 \tag{3}$$

(ii) Probability that only 3 cards are spades is P(3).

$$P(3) = \binom{5}{3}\left(\frac{1}{4}\right)^3\left(\frac{3}{4}\right)^2 \tag{4}$$

$$= \frac{45}{512} \approx 0.08789 \tag{5}$$

(iii) Probability that no card is spade is P(0).

$$P(0) = \binom{5}{0}\left(\frac{1}{4}\right)^0\left(\frac{3}{4}\right)^5 \tag{6}$$

$$= \frac{243}{1024} \approx 0.23730 \tag{7}$$
