**Exercise 12.13.5.4** Five cards are drawn successively with replacement from a well-shuffled deck of 52 cards. What is the probability that

- (i) all the five cards are spades?
- (ii) only 3 cards are spades?
- (iii) none is a spade?

**Solution.** A deck has 52 cards among which 13 are spades. Since we are replacing drawn cards ,the probability of getting spade on any draw,  $p = \frac{13}{52} = \frac{1}{4}$ . This is a binomial distribution where getting a card of spades is considered success.

The probability of getting r successes in a binomial distribution having n) independent Bernoulli trials and probability of success in each Bernoulli trial being p is

$$\Pr(r) = {}^{n}C_{r}p^{r}(1-p)^{n-r} \tag{1}$$

Here,  $p = \frac{1}{4}$  and n = 5.

(i) Probability that all 5 cards are spades is Pr (5).

$$\Pr(5) = {}^{5}C_{5} \left(\frac{1}{4}\right)^{5} \left(\frac{3}{4}\right)^{0} \tag{2}$$

$$=\frac{1}{1024}\approx 0.00098\tag{3}$$

(ii) Probability that only 3 cards are spades is Pr(3).

$$\Pr(3) = {}^{5}C_{5} \left(\frac{1}{4}\right)^{3} \left(\frac{3}{4}\right)^{2} \tag{4}$$

$$=\frac{45}{512}\approx 0.08789\tag{5}$$

(iii) Probability that no card is spade is Pr (0).

$$\Pr(0) = {}^{5}C_{0} \left(\frac{1}{4}\right)^{0} \left(\frac{3}{4}\right)^{5} \tag{6}$$

$$=\frac{243}{1024}\approx 0.23730\tag{7}$$
